

Casenet Angular 2 Test

The image shows a browser window with a navigation bar at the top containing back, forward, and refresh icons, followed by an empty address bar. The main content area is split into two sections. On the left, there is a blue hyperlink labeled "Open Contact Slideout". On the right, a "Contact" slideout is open. The slideout has a title bar with the word "Contact" and a close button (an 'X' icon). Inside the slideout, there are three input fields: "Name" (a single-line text box), "Surname" (a single-line text box), and "Message" (a multi-line text area with the placeholder text "Enter text ..."). At the bottom right of the slideout, there is a "Send" button.

Create a Slideout component that will appear once you click on the 'Open Contact Slideout' link.

The Slideout component should be a reusable component that can host any kind of content and any kind of action in the footer of the Slideout.

In the test scenario, we use the Slideout component to host a Contact form that will be sent once the user hits send.

You can close the Slideout by hitting the 'x' icon on the top right corner.

Once we hit send, the Slideout will close and the data from the form will be printed into the console.

Consider there could be more than one Slideout opened at a time and there's no need to implement any effects, the Slideout will just appear and disappear.
